

SECURE DATA DESTRUCTION

destroyData®

ON SITE HARD DRIVE SHREDDING TRUCK

PROTECTING YOUR BUSINESS

This truck provides an on-site degaussing and destruction that's not only safe and secure, but also fully POPI Act compliant. It offers mobile data destruction services that include the physical shredding of 300 hard drives, 500 data tapes, and USB sticks and up to 400 mobile phones every hour. The mobile facility also offers the digital shredding of other media devices including solid state drives and data tapes.

The main advantage this truck brings to data security is that it eliminates the need to provide a “chain of custody” for client’s data because the truck comes to the client’s premises. Hard drives made of aluminum, steel and other metal alloys require huge amount energy to shred into tiny pieces and that would normally happen in an industrial factory.

SECURE DATA DESTRUCTION

SOFTWARE ERASURE

Advance digital data elimination allows the hard disk drive to be reused, making this method the most environmentally compliant.

Our software solution provides an audit trails that captures additional inventory criteria like HDD & machine serial number, technician, process passed and date, it also produces individual disposal certificates for hard disk drives. Software erasure is usually the preferred option for newer equipment where the charges can be recovered from the residual value from the unit being disposed.

DEGAUSSING

This process uses a magnetic charge to eliminate the magnetic field which stores data on the hard drive, the process is fast and comes with an audit trail and certificates to ensure the method is secure.

Degaussing can be used on tapes media and HDDs as it destroys other components preventing the media from being reused, all media is then environmentally recycled.

DESTROY DATA ON ALL MEDIA, OFFSITE & ONSITE
